

COLORPLATE[®] test developed by Dr Knapp with resonance ionization images

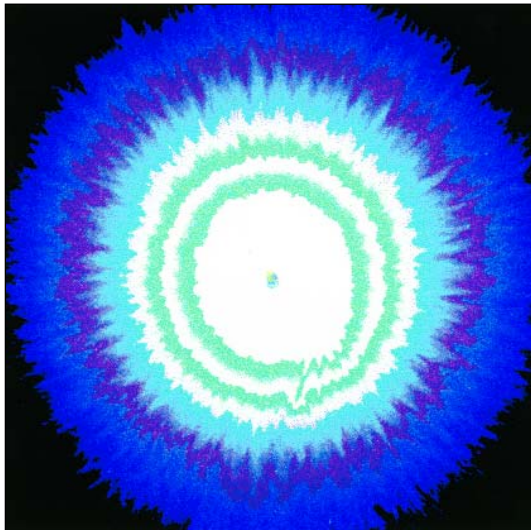

Test image of tap water which has not been purified immediately after it has come out of the tap:

the relatively symmetrical shape of the drop reveals that polarization is quite weak.

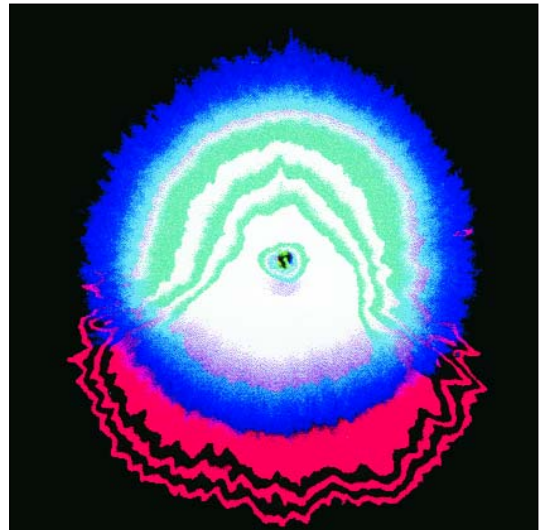

Test image of tap water immediately after it has been energized in the UMH process:

it clearly shows polarization (red area below, turquoise area above), indicating a build-up of a very strong bio-electric field (condition) *) in the water.

Test image of tap water one day after it has come out of the tap:

a tendency towards polarization is no longer visible in this image.

Test image of tap water one day after it has been energized in the UMH process:

the results clearly show that the water is still strongly energized after having been treated in the UMH appliance. This state was still clearly detectable on the second day.

*) Biochemical regulation mechanisms can only take place trouble-free in our organism when the water complies with certain biophysical conditions, primarily associated with "bioelectrical or magnetic states" which are responsible for the bioenergetic balance in organisms. Ultimately the "vitality" of water is determined by its "bioenergetic condition". At the same time, water is a vital medium for life-giving energy.
